

Breadcrumb Block

Map to Existing Breadcrumb Component

A navigational trail showing the current page's position within the site hierarchy.

Authoring Criteria:

- No block authoring needed. Breadcrumbs are controlled entirely through metadata.
- Authors enable or disable breadcrumbs per page by setting the Breadcrumbs metadata property to true.
- By default Breadcrumb will be true. A custom metadata property can be added to page properties to skip a page from navigation and setting starting breadcrumb position.
- Bulk metadata can enable breadcrumbs across an entire subsection or site-wide.
- The breadcrumb links are generated dynamically based on the page's URL path – no manual link entry required.
