

CTA Block

Note the red ‘play button’ (right arrow) is from classic. The blue play button to the left of the text is what we should use moving forward. **Overview**

The **CTA (Call-To-Action) / Button block** is designed as a reusable and flexible component to support various button styles and use cases across the site.

It is intended to:

- Support multiple visual styles (e.g., primary, secondary, outline, CTA arrow, video, download, etc.)
- Allow icon-based buttons with explicit authoring control

Given its wide usage (across a large number of pages), the CTA is implemented as a **dedicated block with shared configuration and styling**.

2. Authoring Model

CTA Fields

Authors can configure the following fields:

Field Name	Description
Button Text	Label displayed on the CTA
URL	Target link for the CTA
Open in New Tab	Boolean flag to open link in a new tab
Icon	Optional icon to display with the CTA (Arrow, Document, Download, Print etc)
Type (Style)	Visual style of the CTA

CTA Style Variants

The **Type field** allows authors to select from predefined styles such as:

- Primary

- ~~Secondary~~
- Outline
- Link
- ~~Video~~

This ensures **consistent styling and behavior across the site**.

Additional variants will be added during implementation.

Note: The red 'play button' (right arrow) is from classic. The blue play button to the left of the text is what we should use moving forward

3. Usage Patterns

3.1 Standalone CTA (Button Block)

- Authors can directly add a **CTA block** to the page
- Configure all CTA properties via block authoring
- Suitable for:
 - Inline CTAs
 - Section-level actions
 - Independent call-to-actions

3.2 CTA within Other Blocks

CTA is also reused inside other components such as:

- Cards Block

In such cases:

- CTA fields are exposed as part of the parent block authoring
 - Authors configure CTA within the context of the parent component
 - The rendering follows the same styling and behavior as the standalone button
-

4. Reusability via Partial

To enable reuse and maintain consistency, CTA fields are defined as **shared partials**.

What are Partial?

- Partial are reusable field definitions
- They allow the same set of fields (CTA configuration) to be reused across multiple blocks

How CTA Uses Partial

- A shared CTA partial defines:
 - Button text
 - URL
 - Open in new tab
 - Icon
 - Type
- This partial is:
 - Used in the **Button block (standalone usage)**
 - Referenced inside other blocks (e.g., Hero, Teaser)

This ensures:

- No duplication of field definitions
 - Consistent authoring experience
 - Easy updates (change once, reflect everywhere)
-

Reference Structure

- **CTA Fields Partial**

```
models/partials/_cta-fields.json
```

→ Defines reusable CTA fields

5. Reusability & Consistency

- CTA configuration is **standardized and centrally managed**
- Style and icon options are shared across all implementations
- Same CTA structure is used:
 - In standalone button blocks
 - Inside other blocks

This ensures:

- Uniform authoring experience
- Consistent UI/UX across the site
- Better maintainability and scalability
