

Text and Image block(Cards)

Authoring Criteria:

- Image – required. A visual associated with the card.
- Title (H2) – optional. The card heading.
- Subtitle (H3) – optional. Secondary text below the title.
- Description (rich text) — optional. Supporting body copy.
- CTA text + link – optional. A call-to-action button or link.
- CTA icon – optional. An icon displayed alongside the CTA.

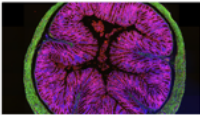

The cards block supports multiple visual variants. Authors can combine variants on a single cards block to control layout, image treatment, and overall presentation.

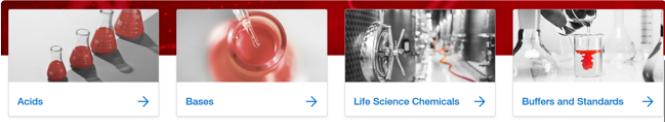

Development Requirements

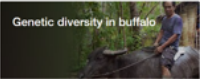

The cards block must be built to support configurable background colors per card or per cards block instance, allowing authors to match brand and section styling needs.

When a card contains only an image and a CTA link, the block must wrap the image in the link to make the entire card clickable. No separate variant is needed — the block should adapt based on which optional fields are present.

Variant	Description	Reference
---------	-------------	-----------

default	Image at the top, gray border Default 3 col layout	 Advanced verification Advanced specificity testing aligned with ISO/IEC 17025 verification standards. Learn more about our advanced verification antibodies  Publication-backed performance Trusted and cited in leading peer-reviewed research journals. Find publication backed antibodies  Antibody performance guarantees Purchase with confidence with our antibody performance guarantees.
